INVESTMENT PROCESS

1700 STOCK UNIVERSE

The first step in the investment process is to screen the relevant universe of 1700 stocks to identify companies we believe likely to out-perform using a proprietary screen called Return Pattern Recognition®.

The screen identifies companies currently exhibiting specific financial and economic characteristics that have historically proceeded periods of outperformance for stocks in their respective industries.

150 BEST COMPANIES

The approximately 150 best companies identified in the screening process are put through a second more rigorous review. EARNEST

Partners develops an investment thesis for each company. This thesis must be tested and generally includes conversations with the company's management team and industry specialists, a review of the company's financial reports and condition, and other factors.

FINAL PORTFOLIO

The final step is to construct a portfolio that includes those stocks that are expected to have the best performance and that potentially can effectively manage risk. A statistical approach called downside deviation is used to measure the likelihood of significantly underperforming the assigned benchmark. Using this information, investments are selected that blend together in an effort to mitigate downside risk.

ABOUT THE HANCOCK HORIZON FUNDS

Hancock Horizon Funds, founded in 2000, managed over \$485 million in assets as of June 30, 2020 in equity, state specific income, and liquid alternative funds. Hancock Horizon Funds manages 9 different funds for our clients.

Carefully consider the Funds' investment objectives, risks, charges and expenses before investing. This and other information, including performance, can be found in the Funds' summary or full prospectus, which may be obtained at www.hancockhorizonfunds.com or 800-990-2434. Please read the prospectus carefully before you invest or send money.

Mutual fund investing involves risk, including possible loss of principal. International investments may involve risk of capital loss from unfavorable fluctuation in currency values, from differences in generally accepted accounting principles, or from social, economic or political instability in other nations. Emerging markets involve heightened risks related to the same factors as well as increased volatility and lower trading volume. Current and future holdings are subject to risk. Diversification may not protect against market risk. There is no guarantee the Fund will achieve its stated objective.

Alpha is a measure of the portfolio's risk-adjusted performance. When compared to the portfolio's beta, a positive alpha indicates better than expected performance. Beta measures the fund's sensitivity to market movements; beta greater than 1 is more volatile than the market. R-Squared is a formula that determines how much a variable's behavior can explain the behavior of another variable. Sharpe Ratio uses standard deviation to measure a portfolio's risk-adjusted returns. The higher a portfolio's Sharpe Ratio, the better the portfolio's returns have been relative to the risk it has taken. Standard Deviation measures the volatility of the fund's returns. Higher deviation represents higher volatility. Sharpe Ratio uses a fund's standard deviation and its excess return (difference between the fund's return and the risk-free return of 90-day Treasury Bills) to determine reward per unit of risk. Downside Deviation is a measure of downside risk that focuses on returns that fall below a minimum threshold or minimum acceptable return.

Horizon Advisers serves as investment advisor for the Hancock Horizon Family of Funds. The Hancock Horizon Family of Funds is distributed by SEI Investments Distribution Co. (1 Freedom Valley Drive, Oaks, PA 19456), which is not affiliated with Hancock Whitney Corporation, or any of its affiliates. The Hancock Horizon Family of Funds may not be available in all states.
